---

DOF Tools develops, manufactures and sell cutting tools made from solid carbide. The company and our innovations are sprung from several years of research and practical experiences in machining and heat generation.

We want to be an active part of the environment we live in, that is why we have introduced management for quality and environment. Since October 12th 2012 we are certified according to ISO 9001 and ISO 14001.

## QUALITY

For us it is a requirement that we in all situations supply high quality solutions. This is something we are well known for. As a step in our expansion there are always higher requirements for monitoring, availability and swift service. In the dialogue with our customers we find ways to constantly improve us and our subcontractors.

## ENVIRONMENT

In the industrial sector we are working in, environment is a general matter. The environment is in focus in a natural way in every business we do. To stay competitive in an industry where environment is an important aspect, we need to continuously find solutions for ineffective processes. In our business it is a direct link between effectiveness and less environmental impact. The durability of our products is world class, which results in less use of raw materials.

Our customers does not accept anything else than environmentally approved technology which follows the directives set up to follow. We continuously monitor and improve our environmental work by setting up goals which are all-embracing based on our customers requirements and the environmental aspects. The commitment to comply with laws and other requirements is a natural part of our everyday work.

# HIGH PRODUCTIVITY

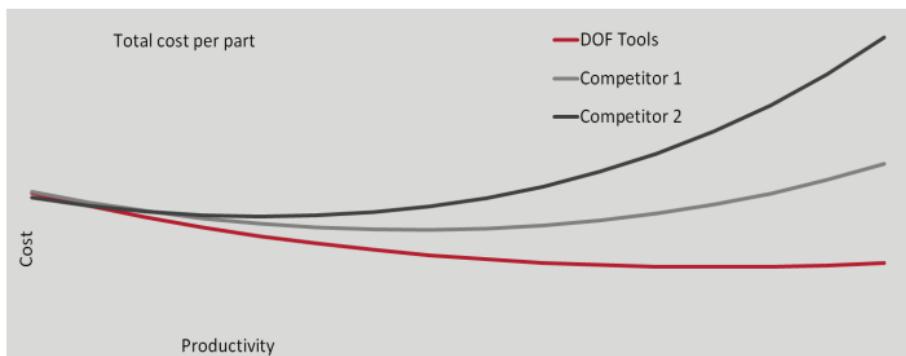

5.

Demonstrated in the graph below are the fixed costs per part, and tool cost per part, as function. The fixed costs per part decreases and the tool cost per part increases as productivity increases. Different tools withstand high productivity in various degree. See the graph below:

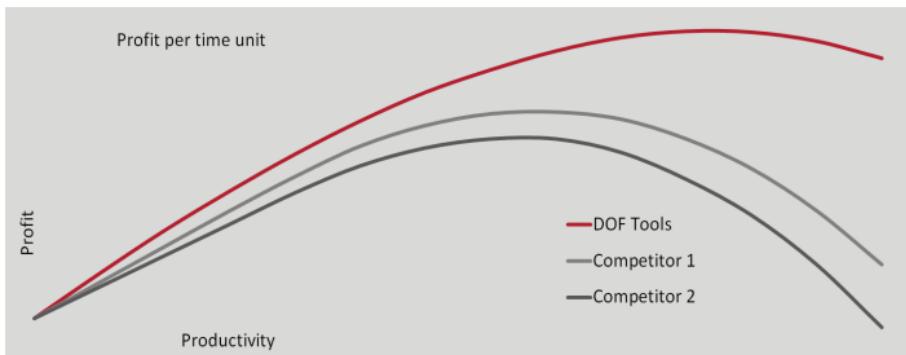

## LOWER MANUFACTURING COSTS, HIGHER PRODUCTIVITY

Since our tools can withstand high productivity to a greater degree, the result is more parts produced at a lower cost. See the graph below:

## GREATER PROFIT PER PART AND MORE PARTS

When the profit is calculated the effect is double, lower cost per part and higher productivity.  
See the chart below:

## IMPLEMENTATION

On the following pages there are methodology, rule of thumb, formulas and arithmetical examples for adaption to specific cases. On page 39 there is a table with cutting parameters.

## PROFITABILITY CALCULATIONS

In this case, profitability calculations describes how tool cost can be evaluated with regards to productivity and overall production economy.

When profitability is calculated, two bases for evaluation is possible.

First: Minimize the manufacturing cost per part.

Second: Maximize profit per unit of time.

## FIRST BASIS

This approach is easier to calculate and is well-defined in literature.

The general idea is to find a maximum of the sum of fixed costs per part and tool cost per part. Included in the fixed costs are all the costs which are influated by the number of parts produced per unit of time, (mantime cost, machine cost, overhead etc) but no costs specifically tied to a specific part (raw material etc).

The fixed cost per part decrease and tool cost increase with higher productivity. This can be represented by one curve which increases, and another which decreases with higher productivity. It is possible to mathematically determine a minimum of the sum of the two curves. For an exact determination, use the formulas on page 9 and forward. The rules of thumb can also be used.

## RULES OF THUMB

- » It is the cost per produced hole which is determining, not the fixed cost or the tools cost alone.
- » High machine cost requires high productivity and vice versa.
- » High overhead (rent, cost for development, quality control, programming etc) requires high productivity and vice versa.
- » Greater tool ability to withstand high productivity enables higher productivity.
- » Greater added value enables higher productivity.

# PROFITABILITY

---

## SECOND BASIS

The general idea with this approach is that increased productivity enables less margin. This means focus on profit in euro instead of profit in percent. Otherwise it is the same basis for calculation and the same rules of thumb.

First example: 10 parts per hour are produced with a margin of 10 euro (100 euro profit/hour).

Second example: 15 of the same parts per hour are produced, but with a margin of 8 euro (120 euro profit/hour).

If the reduction in margin per part (A) and increased productivity (B) cancel each other out ( $A+B=1$ ), it gives the same profit/hour.

It is harder to make calculations with this approach and it requires more testing, but gives a more accurate result if the goal is to maximize the profit per unit of time.

## FORMULAS AND METHODOLOGY

On the next page (p. 10) there are formulas and methodology for comparing two known setups and see which gives the lowest total production cost per part and greatest profit per hour. Setup in this case could be either two different tools or the same tool brand but with different productivity and tool life.

The following parameters must be known for both setups:

$K_{mc}$	Machine cost per hour	(€)
$K_{mt}$	Man cost per hour	(€)
$K_{oh}$	Overhead cost per hour	(€)
$L_d$	Total hole depth per part	(mm)
$X\%$	Drilling operations	(%)

Fixed cost per hour, is per effective production hour. Disturbance, quality problems etc in the production increase the fixed cost per hour.

The following parameters must be known but are different for both setups:

$K_{v1}, K_{v2}$	Tool cost per tool life	(€)
$V_{f1}, V_{f2}$	Feed	(mm/minute)
$V_{l1}, V_{l2}$	Tool life	(m)

First, the number of tool life per hour is calculated for both setups ( $N_{v1}$  resp.  $N_{v2}$ ):

$$N_{v1} = \frac{V_{f1} \times 60}{V_{l1} \times 1000} \quad N_{v2} = \frac{V_{f2} \times 60}{V_{l2} \times 1000}$$

Then, the number of parts produced per hour is calculated for both setups ( $N_{o1}$  resp.  $N_{o2}$ ):

$$N_{o1} = \frac{V_{f1} \times 60 \times X\%}{L_d \times 100} \quad N_{o2} = \frac{V_{f2} \times 60 \times X\%}{L_d \times 100}$$

It is now possible to calculate the total production cost per part for both setups ( $K_{tot1}$  resp.  $K_{tot2}$ ).

$$K_{tot1} = \frac{K_{mc} + K_{mt} + K_{oh}}{N_{a1}} + \frac{K_{v1} \times N_{v2}}{N_{a1}}$$

$$K_{tot2} = \frac{K_{mc} + K_{mt} + K_{oh}}{N_{a2}} + \frac{K_{v1} \times N_{v2}}{N_{a2}}$$

The setup which gives the lowest  $K_{tot}$  is the best setup if the goal is to minimize the total production cost per part.

## PROFIT CALCULATIONS

When the total production cost per part for both setups is known, there is a possibility to proceed and calculate profit per hour ( $P_{h1}$  and  $P_{h2}$ ) and profit per tool ( $P_{v1}$  resp.  $P_{v2}$ ).

The following parameter must be known:

$P_{a1}$  value added per part produced 1 (€)

$P_{a2} = P_{a1} + K_{tot1} - K_{tot2}$  value added per part produced 2 (€)

Profit per hour ( $P_h$  and  $P_{h2}$ ) (€):

$$P_{h1} = P_{a1} \times N_{a1}$$

$$P_{h2} = P_{a2} \times N_{a2}$$

Profit per tool ( $P_{v1}$  and  $P_{v2}$ ) (€):

$$P_{v1} = \frac{P_{h2}}{N_{v2}}$$

$$P_{v2} = \frac{P_{h2}}{N_{v2}}$$

## DRILLING

**DOF K+** Drill for specific material groups (see next page)

**DOF P+** Drill for specific material groups (see next page)

**DOF A+** Drill for specific material groups (see next page)

All geometries are designed for high productivity in the form of increased feed.

## TOOLS FOR SPECIAL APPLICATIONS

**SEMISTANDARD** Adaption for specific diameter

**DOF BRBS** Drill with four land margins based on optional base geometry

**STEP TOOLS** Based on optional base geometry

**MILLS** End mills and ball nose mills tailored for specific cases

**PROFILE TOOLS** High accuracy profiles, concave radius or side milling cutters with gear teeth profile

# GEOMETRY SELECTION

13.

This is an overview of which geometries that are suited for which materials. The chart should be interpreted as following:

Not recommended

Recommended in certain applications

Recommended

ISO	Geometry			Material group	
	p+	k+	a+		
P	●	●	○	1	Low carbon steel
	●	●	○	2	
	●	●	○	3	
	●	●	○	4	Low alloy steel
	●	●	○	5	
	●	●	○	6	High alloy steel
	●	●	○	7	
M	●	●	○	8	Stainless steel
	●	●	○	9	
	●	●	○	10	
K	●	●	○	11	Nodular cast iron
	●	●	○	12	
	●	●	○	13	Difficult cast iron
N	●	●	●	14	Aluminium
	●	●	●	15	Brass/Copper Alloys
S	●	●	○	16	Super alloys (Ni-base)
	●	●	○	17	
	●	●	○	18	Super alloys (Ti-base)
H	●	●	○	19	Hardened steel
	○	●	○	20	
					Hardness 48-55 HRc
					Hardness 55-65 HRc

Following charts displays our stock items. A web shop with current stocks will be introduced on our webpage ([www.doftools.se](http://www.doftools.se)) during 2013/2014.

## DESIGN CRITERIAS

These geometries are designed to withstand high productivity. To achieve this, our whole manufacturing process have been customized.

## GRINDING PROCESS

The most accurate grinding machines offered on the market are used. The grinding process is customized to maintain high repeatability even with tight tolerances. Each geometry is optimized the specific machining conditions in the recommended material groups.

## PREPARATION AND COATING

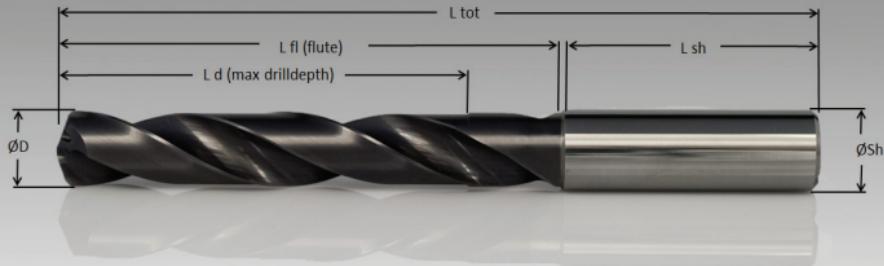

To increase the adhesion of the coating and to strengthen the cutting edges, all tools are subjected to a separate process.

## SURFACE PREPARATION

The drills are prepared in a separate process, after coating, to reduce friction and to improve chip evacuation.

To increase heat transfer and thereby increase tool life, DOF k+ has a unique corner geometry. The centre is designed to reduce axial force.

To summarize, a great combination of productivity and tool life.

DOF p+ geometry has been optimized for chip breaking and chip formation in ductile materials. Four land margins ensures high hole quality even in these materials.

DOF a+ geometry has been optimized for chip breaking and chip formation in aluminium and enables exceptional feed. A concave corner geometry reduces exit burrs.

DOF brbs is a drill reamer with a negative helix ream cut. To ensure a robust process, extra support points and ground channels to guide the coolant flow are added. In most materials H7 tolerance is achieved.

Below there is a simplified description of material groups according to ISO.

ISO	Material group		
P	1	Low carbon steel	Very soft <0.25% C
	2		Soft <= 0.25% C
	3		Normal >=0.25% C
	4	Low alloy steel	Normal <5% alloyed
	5		Harder <5% alloyed
	6	High alloy steel	Annealed >5% alloyed
	7		Hardened >5% alloyed
M	8	Stainless steel	Ferritic/martensitic
	9		Martensitic
	10		Austenitic
K	11	Nodular cast iron	
	12		
	13	Difficult cast iron	
N	14	Aluminium	
	15	Brass/Copper Alloys	
S	16	Super alloys (Ni-base)	Annealed
	17		Cured
	18	Super alloys (Ti-base)	
H	19	Hardened steel	Hardness 48-55 HRc
	20		Hardness 55-65 HRc

---

The recommendations in the table below is to be considered as starting values in machines with good production parameters such as:

## INTERNAL COOLANT

Cutting fluid good lubrication (conc. 5-10 %) approximately 20-40bar pressure. If the pressure is higher, both speed and feed can be increased. If the pressure is lower, both speed and feed should be decreased. If the concentration is lower, decrease the feed and maintain the speed.

## EXTERNAL COOLANT

Cutting fluid for good lubrication (conc. 5-10 %) with accurate and rich flow. If the concentration is lower, decrease the feed and maintain the speed.

## STABILITY

Work part firmly clamped. Tool holding with shrink fit or hydraulic attachment. If vibration occurs, a range of cutting values should be tested to find a minimum. If the breakout of the drill point causes noise, the feed should be reduced by 50 % during breakout. Of roundness or positioning of the hole is bad, pre-drill with 145-150 degrees drill point.

As clearly demonstrated in the chart below, DOF Tools can withstand high productivity in form of increased feed. For brbs (drill reaming), the feed should be reduced with 30-60 % to maintain high hole quality.

ISO	Material group	Cutting speed Vc [m/min]		Feed [mm/rev] (sorted by drilling diameter)				
		Internal coolant	External coolant	Ø3-5	Ø5.1-8	Ø8.1-12	Ø12.1-16	Ø16.1-20
